

Treating Cancer Starts With Knowing You Have It

The Galleri[®] test screens for a unique “fingerprint” of 50+ cancers with one blood draw. We’re making it available to you as a benefit.

How does the Galleri test work?

With a **single blood draw**, the Galleri test screens for DNA fragments from cancer growing in the body.

How long does it take?

The Galleri test takes the time of a single blood draw. Results are available within **about two weeks**.

Why is it important?

Adults over age 50 are 13 times more likely to have cancer and there are only five recommended cancer screening tests. About 3 out of 4 new cancer cases and cancer-related deaths are due to cancers with **no recommended screening tests**. Galleri can help close this gap.

How much does it cost?

The Galleri test is available, as a covered benefit, to eligible employees [and dependents]. If your employee insurance plan doesn’t currently cover the Galleri test, **this open enrollment period is the perfect time to evaluate your healthcare coverage** — and consider switching to a plan that does.

Galleri is available by prescription only. The Galleri test does not detect a signal for all cancers and not all cancers can be detected in the blood. False positive and false negative results do occur. The Galleri test identifies DNA in the bloodstream shed by cancer cells and does not predict future genetic risk for cancer. Galleri should be used in addition to healthcare provider recommended screening tests.

Important Safety Information

The Galleri test is recommended for use in adults with an elevated risk for cancer, such as those aged 50 or older. The Galleri test does not detect all cancers and should be used in addition to routine cancer screening tests recommended by a healthcare provider. Galleri is intended to detect cancer signals and predict where in the body the cancer signal is located. Use of Galleri is not recommended in individuals who are pregnant, 21 years old or younger, or undergoing active cancer treatment.

Results should be interpreted by a healthcare provider in the context of medical history, clinical signs, and symptoms. A test result of No Cancer Signal Detected does not rule out cancer. A test result of Cancer Signal Detected requires confirmatory diagnostic evaluation by medically established procedures (e.g., imaging) to confirm cancer.

If cancer is not confirmed with further testing, it could mean that cancer is not present or testing was insufficient to detect cancer, including due to the cancer being located in a different part of the body. False-positive (a cancer signal detected when cancer is not present) and false-negative (a cancer signal not detected when cancer is present) test results do occur. **Rx only.**

Laboratory/Test Information

The GRAIL clinical laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) and accredited by the College of American Pathologists (CAP). The Galleri test was developed, and its performance characteristics were determined by GRAIL. The Galleri test has not been cleared or approved by the Food and Drug Administration. GRAIL’s clinical laboratory is regulated under CLIA to perform high-complexity testing. The Galleri test is intended for clinical purposes.
